

Affect shifts a battery of judgments — all 6 move in the predicted direction

Causal: steering the affect axis (+a vs -a) **Input: text-affect prime (distress vs positive)**

Gemma-3-12B, text-valence axis. Every behavior moves in the human-predicted direction under BOTH a causal steer (left, vs a near-zero random control) and a text-affect prime (right). Risk estimation is the one whose steering effect is not clearly above its random control — its prime effect (+31) carries it.
