

Emotional images causally shift task behavior (same direction as steering, on affect-congruent tasks)

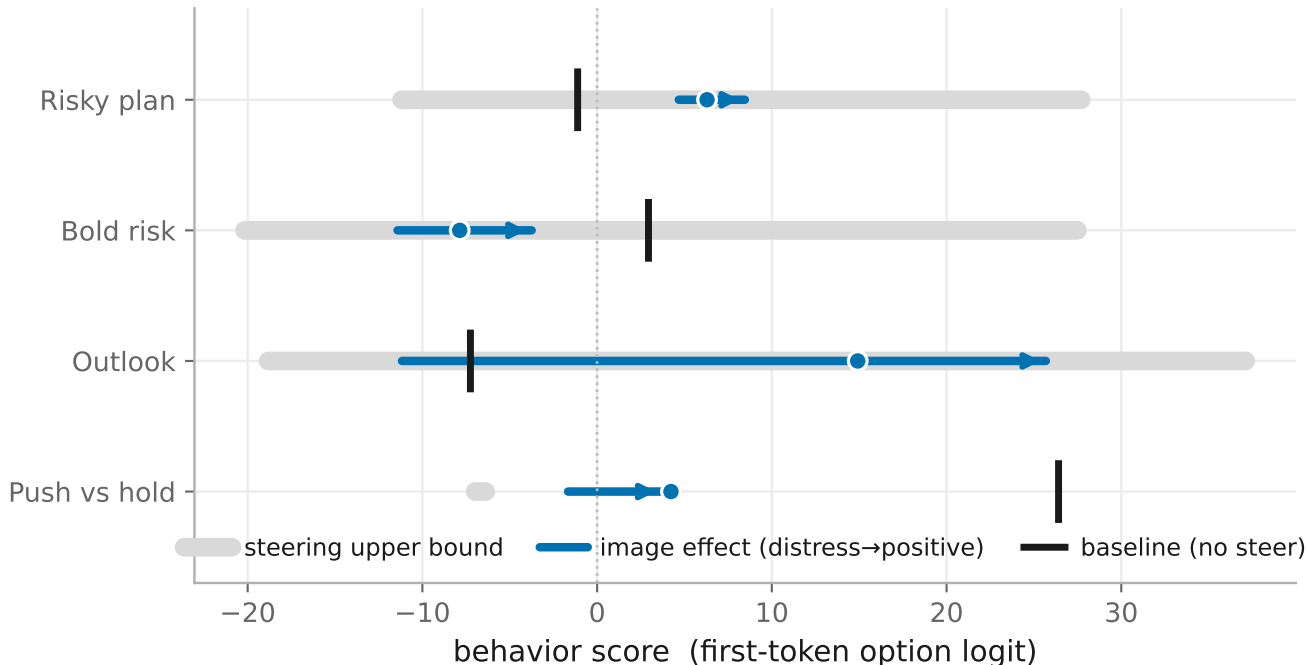

Image effect (blue) vs the steering-reachable range (gray) and the unsteered baseline (black tick). For 3/4 tasks the image effect moves in the same direction as steering, and steering brackets the baseline. For 'Push vs hold' (bottom) the baseline (+26) sits far outside the collapsed steering range — steering both ways drops the score, so the axis does not cleanly control this task.
