

**Clamping barely restores refusal (0.17)  
and wrongly refuses benign inputs (0.81)**

**Detection separates  
attack from benign**

A steering attack removes refusal (1.0→0.0). Clamping the affect projection restores only 0.17 of harmful-input refusal while wrongly refusing 0.81 of benign inputs; a projection detector separates attacked from benign at AUROC 1.0 — detection beats clamping.
